

# Paradiso.

An early maincrop, large growing export variety with a good yield.

- Oval long tubers with a regular size and a light yellow flesh colour.
- A quite firm cooking type and suitable for midterm storage.
- Resistant to wart disease (1), less susceptible for harvest damage and black spot.

## Characteristics

### Purpose

Market segment                      general purpose

### Plant characteristics

Maturity                                      5,5  
Initial development                      7,5  
Flower colour                                P

### Tuber characteristics

Skin colour                                    Y  
Flesh colour                                    6  
Tuber shape                                    OL  
Tuberisation                                   6  
Tuber size                                       8  
Regularity of size                           7  
Skin finish                                       7  
Superficiality of eyes                      6,5  
Underwater weight                          323  
Dry matter content                          18,1%  
Cooking type                                    B  
Suitability for French fries                4,5  
Harvest damage                               7  
Black spot                                       7,5  
Dormancy                                        6

### Resistances

Golden nematode: RO 1 and 4            9  
Golden nematode: RO 2 and 3            1  
White nematode: PA 2                        1  
White nematode: PA 3                        1  
Y<sup>n</sup>-virus    6  
Y<sup>mn</sup>-virus    8  
Common scab                                    5,5  
Powdery scab                                    8  
Late blight-foilage                            6  
Late blight-tuber                              6,5  
Spraing    4  
Wart disease 1                                   10  
Metribuzin                                        8
